Buy Queens Dahlias

They Grow Better

PLANTING AND CARE OF DAHLIAS

Scatter about five pounds of good fertilizer called 487 or 488 or any good fertilizer you can get. Five pounds of fertilizer would be enough to cover 40 dahlias. Then spade the Garden. Then drive stakes in the ground to hold the dahlias from being broken by rain or wind. Next dig a hole six inches deep and lay the dahlia in the hole flat, with the sprout upward and cover the dahlia with two inches of soil. Do not fill the hole up. Fill the hole as the dahlia grows up. Allow only one sprout to grow, pinch all others that grow. About the first of August scatter one handfull of the same fertilizer and one handful of sheep manure around each plant, keeping it six inches away from the dahlia plant. About August 15th repeat the same treatment. Dahlias like plenty of water and should be soaked every ten days, and oftener while in bloom. Always cultivate well after watering. As soon as the ground is dry enough to work in order to loosen up the crust that has formed. The more you cultivate the better result you get. During the hot days of summer, insects or pests such as aphids, thrips, leaf hoppers and green flies and cucumber beetles are generally attacked by them. If any of these pests should be noticed on or around the plants they should be sprayed at once with a good insecticide. It is best to spray before any insects appear rather than to wait until they make their presence known. In the latter case many times the plants are stunted from these pests. We have found the best way to hold these pests in check is to spray the plants with Red Arrow.
